

5 Reasons

Procedure Areas Are Switching to QSight®

Supply chain managers at hospitals, especially those for critical areas like the operating room, cardiac cath lab, and electrophysiology labs face tremendous challenges. All too often they are relying on manual tasks and laborious processes to manage inventory. The results are predictable: costs that are too high and little to no visibility into their supply chain. It doesn't have to be that way. That's why many hospitals are turning to QSight, Owens & Minor's industry-leading, cloud-based, perpetual inventory management system. Read on to learn five reasons these hospitals are making the switch to QSight.

ELIMINATES
MANUAL
TASKS

01

With QSight, many of the tasks once done by hand are eliminated. For instance, instead of manually typing a bar code to take product in or out of inventory, users scan the bar code of a product instead. And rather than manually counting product to determine inventory levels, those inventory levels are automatically maintained within QSight, easily accessible to users.

PROVIDES
GREATER
VISIBILITY

02

QSight lets users peer deep into their inventory, allowing them to quickly see inventory levels, products on order, products on backorder, products below par, overstocked products, usage patterns in real time, and so much more. Gone are inventory-tracking spreadsheets maintained by hand or eyeballing inventory levels. Instead, the information you need is right there in QSight just a few mouse clicks away.

CUTS
COSTS

03

With greater visibility into their inventory, Supply Chain Managers can make smarter, better-informed decisions about every facet of their supply chain, from what products to order, when to order them, how much to order and where to place them. The end result is often a dramatic reduction in costs throughout the supply chain, from supply spend to reduction in overstocks to inventory reductions.

REDUCES
RISK

04

With the UDI (Unique Device Indicator) including lot & expiration date being captured with a scan and linked to a 600,000 item database, managing recalls and expired products is far easier with QSight, enabling users to mitigate their liability risks and improve patient safety. Product recalls are matched up with your current inventory, with QSight alerting you to the inventory that must be removed. QSight will even alert a clinician if they try to use a recalled product. And for expired products, users set up custom alerts to trigger when a product is about to expire.

EMPOWERS
CLINICIANS

05

QSight streamlines inventory management and eliminates manual tasks so clinicians can spend more time on what they do best, patient care. With QSight, clinicians simply scan products out of inventory once they are used in a procedure and automatically link it to the patient's EMR. QSight will even alert clinicians before they use a recalled product in a procedure. And with product counts maintained in QSight, clinicians no longer have to count inventory by hand. Ultimately, this means more efficient workflows for clinicians and more time focusing on patients.

ARE YOU READY TO TRANSFORM YOUR SUPPLY CHAIN WITH QSIGHT?

To learn how Owens & Minor can partner with you to solve your unique challenges and take your supply chain to new levels of efficiency, contact us at omlearnmore@owens-minor.com or 1-866-935-0798.
